## **Course Project Proposal for CSL100**

Hello sir, I am Fenil Devganiya and I decided to make course project on Animation and Games for Education using python's pygame module, in which I decided to make a game on our solar system, I can change my topic also but for now I decided to make game on solar system

In this game, firstly in main menu it will give 2 options one is to start and other is "take quiz".

If we click on start, then it will show solar system with sun in centre and planets rotating around it, if we click on planet then it will show some information about that planet, some key facts about that planet and many more.

If we click on "Take quiz" then it will give you random 10 questions with 4 options by which you can check your knowledge and improve it.

By this game, users can learn so many new things about solar system, basically this is for children of small age because they

don't know so many things about space, we can use this to teach about planets and solar system to them by interesting way making joyful environment. Till now I am making only solar system but later we can also add different galaxies, different solar systems also in this game and also about moons of planets and many more things

**Thank you.**
